Personal Presentation Study Guide

This guide is for my personal rehearsal before the seminar defense of:

The Effect of a Market Visualizer on Nigerian Investors: Design, Implementation, and Simulation-Based Evaluation

My Best Overall Message

The safest and strongest way to present my project is this:

I identified real struggles that Nigerian beginner investors face when market information is scattered, weakly explained, and poorly localized. We are building a market visualizer that addresses those struggles through grouped sections, NGX-focused analysis, headline context, AI-assisted explanation, and simulation-based evaluation. The likely effect of the tool is improved clarity, stronger macro understanding, and improved modeled decision support, not a nationally proven effect on all Nigerians.

The Four Real Problems I Am Solving

I should remember these as my anchor problems:

1. information is scattered across many places
2. NGX context is weaker than foreign-market context in many tools
3. beginners see charts but do not fully understand them
4. many users drift toward TikTok-style advice instead of structured market context
5. there is no simple way to compare baseline understanding with assisted understanding

My Alpha Points To Stress

These are the strongest design-to-effect points I should repeat confidently:

1. grouped sections reduce fragmentation by keeping charts, headlines, news, AI explanation, and simulation in one flow
2. Top Headlines and broader market context push the user toward macro understanding instead of TikTok-style tips
3. the NGX-first workflow restores Nigerian relevance and naira-native interpretation
4. the AI layer reduces beginner confusion around trend, volatility, and risk
5. the simulator gives a reproducible way to compare baseline and assisted decision behavior

Very Important Warning For Myself

I must never present the project as:

- proof that all Nigerians improved
- a forecast engine for NGX prices
- a replacement for financial judgment
- a completed national experiment

I should present it as:

- a real software artifact in progress
- a response to concrete Nigerian beginner-investor struggles
- a likely or modeled effect on understanding and decision support

My 30-Second Opening

Good day everyone. My seminar topic is The Effect of a Market Visualizer on Nigerian Investors: Design, Implementation, and Simulation-Based Evaluation. This work began from a practical Nigerian problem: many beginner investors can access prices, headlines, and market data, but they still struggle because information is scattered, NGX support is often weaker than foreign-market support, charts are not always easy to interpret, and many users drift toward social-media investment tips instead of structured market context. To respond to this, we are building a market visualizer with NGX-focused workflows, grouped sections, AI-assisted explanation, and simulation-based evaluation. My presentation begins with those real struggles, then shows how the tool responds to them and what the results suggest.

Slide-By-Slide Rehearsal

Slide 1 — Title

What I should say:

This seminar is about the effect of a market visualizer on Nigerian investors. I will first explain the real Nigerian beginner-investor struggles, then show sneak-peek demo views of what we are building, how we are building it, and why the effect can matter.

Transition:

I will begin with the practical problems that exist before the tool is even introduced.

Slide 2 — Tangible Struggles Nigerian Beginners Face

Main point:

The problem must sound real, visible, and local.

What I should say:

NGX information is often scattered across broker apps, exchange pages, news sites, WhatsApp groups, and social-media posts. Many beginners can see prices but still cannot clearly interpret trend, volatility, or risk. Many users also end up following influencer tips or TikTok-style advice because the information is not grouped in a way that supports understanding.

Best sentence:

Without a local visualizer, analysis becomes fragmented, slow, and easy to misunderstand.

Slide 3 — What Happens Without The Tool

Main point:

Show the consequences of the problem.

What I should say:

When there is no connected tool, beginners jump between many sources before understanding one asset. Local context is weak because many platforms are stronger for foreign markets than NGX. And when charts, headlines, and explanation are not grouped clearly, users may depend on rumor, hype, or TikTok-style advice.

Best sentence:

The real danger is not only missing data, but making decisions from scattered and weakly interpreted information.

Slide 4 — Sneak Peek Demo Of What We Are Building

Main point:

Now I introduce the tool as a response, not as the starting point.

What I should say:

The home page gives one place to begin. The NGX workflow restores local-market context. The AI view explains what the user is seeing without forcing them to leave the platform. The headline sections also push the user toward macro context before reacting to price. So the tool responds directly to fragmentation, weak local context, weak explanation, and social-media noise.

Slide 5 — What We Are Building

Main point:

Show the product has depth, but describe it as a sneak peek.

What I should say:

This is not just one screen. The system includes grouped analysis workspaces, Top Headlines, broader market context, and multiple connected pages. I should describe this as more sneak-peek demo of what we are building, not as a final finished product.

Slide 6 — Why This Matters In Nigeria

Main point:

Return to local relevance.

What I should say:

This matters because many beginners rely on scattered online commentary, and social-media information can be fast but incomplete or noisy. A clearer NGX-first platform may reduce confusion and push users toward headlines, macro context, and more careful learning. This is why the project is Nigerian in relevance, not just general in topic.

Best phrase:

The project is designed to reduce confusion, restore local context, and make Nigerian market analysis easier to understand.

Slide 7 — How A User Moves Through The Tool

Main point:

Show the full workflow.

What I should say:

The user chooses an asset, reads grouped chart sections, reviews top headlines and broader market context, asks AI for clarification, and then compares baseline and assisted outcomes in the simulator. This shows that the tool is a connected learning and analysis workflow.

Slide 8 — What We Are Building

Main point:

Explain the system in simple technical language.

What I should say:

We are building a React frontend, connected market views, an AI explanation layer, and a simulation engine. The important point is that charts, headlines, explanation, and evaluation are kept inside one connected system.

Slide 9 — Alpha Points: How The Visualizer Tackles Each Problem

Main point:

This is the strongest problem-to-solution summary.

What I should say:

Scattered information is answered by grouped sections that keep charts, headlines, news, AI explanation, and simulation in one flow. Weak NGX support is answered by the NGX workspace. TikTok-style advice is answered by Top Headlines and broader news context, which push the user toward macro understanding before reacting. Poor explanation is answered by the AI layer. This slide clearly shows that each design choice responds to a specific problem.

Slide 10 — Measured Effect

Main point:

This is my strongest numerical evidence.

What I should say:

In one reproducible Monte Carlo run using a bull scenario, 400 trials, and seed 2026, decision accuracy improved from about 56.1 percent to 70.3 percent. Decision latency reduced from about 7.70 to 6.00. Risk score reduced from about 0.540 to 0.420. Simulated return improved from about 0.065 to 0.182. These are modeled outputs, not market forecasts.

Numbers to remember:

- 56.1 percent -> 70.3 percent accuracy
- 7.70 -> 6.00 latency
- 0.540 -> 0.420 risk
- 0.065 -> 0.182 return

Slide 11 — Effects We Expect To See

Main point:

Return to practical outcomes, not abstract theory.

What I should say:

Grouped sections may reduce overload. Top Headlines and broader news context may improve macro understanding. The NGX workspace may improve local relevance. AI may reduce confusion around trend, volatility, and risk. The simulation suggests better modeled performance under assistance. So the strongest expected effects are clarity, macro awareness, local relevance, and improved modeled decision quality.

Slide 12 — Study Boundaries

Main point:

State the limits before the panel uses them against me.

What I should say:

This is not a brokerage system, not a forecast engine, and not a nationwide field study. Therefore, the effect should be presented as inferred from the system we are building and supported by the model, not as a directly measured national outcome.

Slide 13 — Conclusion

Main point:

Land the safest final claim.

What I should say:

What we are building tackles real Nigerian beginner-investor problems through grouped sections, NGX-first visualization, headline context, explanation, and simulation. My safest final claim is that the visualizer may improve how Nigerian-oriented beginners understand market information.

Slide 14 — Recommendations

Main point:

Show the next stage of stronger evidence.

What I should say:

Future work should test the tool with Nigerian students and beginner investors, measure confusion and interpretation quality directly, and continue strengthening NGX education support and simulation validation.

Three Best One-Sentence Answers

If they ask “What exactly is the effect?”

The effect is the likely and modeled improvement in clarity, macro awareness, local relevance, explanation support, and decision support that the visualizer may provide for Nigerian-oriented beginner users.

If they ask “Did you directly test Nigerians?”

Not through a field study; the effect was inferred from the system we are building and evaluated through case-based observation and reproducible simulation.

If they ask “Why should we take this project seriously?”

Because it addresses a real local problem with a real working artifact, a clear NGX-first design, and a reproducible evaluation method.

Likely Questions And Good Answers

Question 1 — Why is the problem important?

Answer:

Because many beginners already have access to data, but they still struggle because the data is scattered, weakly explained, and not always locally relevant to Nigerian markets.

Question 2 — Why focus on NGX?

Answer:

NGX gives the project its strongest Nigerian relevance. Many tools are stronger for foreign markets, so the NGX workflow directly addresses a local support gap.

Question 3 — Why mention WhatsApp, social media, and online com

Answer:

Because in practice many beginners really do encounter market information through those channels. That makes the problem more tangible and more realistic in the Nigerian context.

Question 4 — What is the main response of the tool to the problem

Answer:

The main response is centralization. The tool brings charts, context, explanation, and simulation into one workflow instead of forcing users to jump between different sources.

Question 5 — What is the role of the AI?

Answer:

The AI acts as an explanation layer. It helps the user understand terms, market moves, and visible context without leaving the platform. It is not presented as autonomous financial advice.

Question 6 — What is the role of the simulation?

Answer:

The simulation gives a structured way to compare baseline and assisted decision behavior. It helps discuss the likely effect of the tool in a repeatable and academically cautious way.

Question 7 — What is your biggest limitation?

Answer:

The biggest limitation is that I did not directly measure real-user behavior through surveys, interviews, or controlled experiments. So my claims are strongest at the level of artifact quality and modeled comparison.

Question 8 — What is your strongest contribution as a computer-sci

Answer:

My strongest contribution is shaping a connected NGX-relevant artifact that turns a real Nigerian beginner-investor problem into a software solution with grouped sections, headline context, and a reproducible evaluation method.

Phrases I Should Use Often

- tangible problems
- scattered information
- weak NGX context
- social-media and TikTok-style advice
- beginner confusion
- one connected workflow
- NGX-first relevance
- likely effect
- modeled effect
- simulation-based evaluation

Phrases I Should Avoid

- I proved that Nigerians improved
- this predicts NGX prices
- this guarantees better investment results
- the AI gives financial advice
- this is national evidence

My Final 20-Second Closing

In conclusion, this project began from real Nigerian beginner-investor struggles: scattered information, weak local context, weak explanation, TikTok-style advice, and no structured comparison. We are building a tool that responds to those problems through grouped sections, NGX-first visualization, headline context, AI explanation, and simulation. The strongest claim I can make is that the visualizer may improve how Nigerian-oriented beginners understand market information and may improve modeled decision support. Thank you.
